

Story of the Stone Golem

PROJECT DESCRIPTION

The goal was to create a toy inspired by the theme of Fairytales. I focused more on designing something fun and visually engaging for rendering, which caused the toy aspect to fade into the

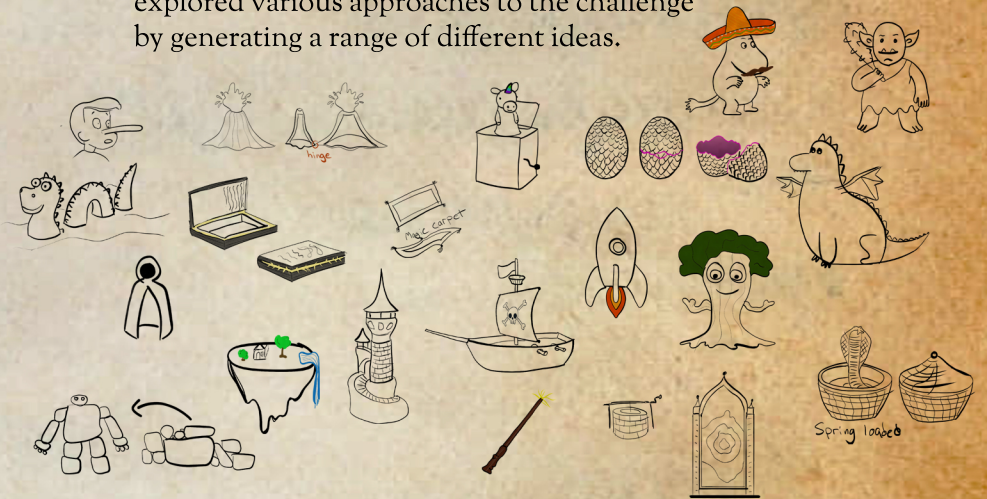

CONCEPT REFINEMENT

Three top concepts were selected for further exploration and visualization.

IDEATION

The process began with an ideation phase, where I explored various approaches to the challenge by generating a range of different ideas.

CONCEPT SELECTION

The stone golem was chosen for its unique concept and the endless possibilities it offers for animation. Using the power of magnetism, the golem can assemble itself and has the ability to form different variations.

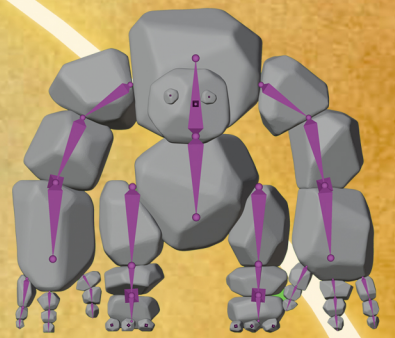

DETAIL DESIGN

The modeling approach began with an initial test to determine if the concept made sense and was worth pursuing. After reviewing the results, I fell in love with the idea. I then created a new version, carefully sculpting each rock to fit its desired position with refined details. An armature with inverse kinematics was implemented to simplify the simulation process. The final step involved creating and applying the material by blending various textures to achieve the desired look.

First Prototype

Refined model with armature
